# Smart Rooms

Standardized meeting room solutions that provide a consistent user experience in every workspace.

Our team of collaboration advisors will help you choose a range of standard meeting room solutions that allows people to perform different activities with the right technology, in a variety of work settings.

Either choose from our standard room designs, or our design team can build a bespoke set of standard rooms specific to your process, roles and workflow. The benefit of this approach is that we build a catalog of solutions, supported by standard and advanced services, that allows you to implement a Smart services framework.

Smart Rooms are designed for the modern workplace and supports the way teams work together to drive a collaborative culture.

Smart Rooms simplify the way we build and deploy meeting room solutions in four easy steps.

Smart Rooms + Smart Monitoring

Smart Room products are carefully assessed, tested and only selected if they have a credible and mature API strategy – this is the foundation of the Smart Room. We use best-of-breed technology and a user-centric design methodology to help you build smart and intelligent meeting rooms.

We measure on quality, ease of use, aesthetics and more. We build solutions that integrate with your services. We provide a better way of ordering with a simplified online catalog for your business.

Smart Monitoring is a secure monitoring and business intelligence platform that provides us with the ability to proactively monitor and assess the status, health and performance of your VC, AV and UC devices and infrastructure.

Additional services options range from solution design and deployment to completely managing and taking full responsibility for every aspect of the meeting experience.
